Accel Precalc Handout: Graphing Sine and Cosine
Unit \#6: Graphs and Inverses of Trig Functions
Lesson \#3: Graphs of Sine and Cosine

EQ:

Part I: $f(x)=\sin (\theta) \quad$ The ordered pairs will be ( $\qquad$ ). The domain, $\theta$, will represent $\qquad$ measures. The range, $\sin (\theta)$, will represent the $\qquad$ value for sine at $\theta$. Use your UNIT CIRCLE to complete each table then create the graphs.

| $x$ | $y=\sin (x)$ | $(x, y)$ |
| :--- | :---: | :--- |
| 0 | 0 | $(0,0)$ |
| $\pi / 6$ | 0.5 | $(\pi / 6,0.5)$ |
| $\pi / 4$ |  |  |
| $\pi / 3$ |  |  |
| $\pi / 2$ |  |  |
| $2 \pi / 3$ |  |  |
| $3 \pi / 4$ |  |  |
| $5 \pi / 6$ |  |  |
| $\pi$ |  |  |
| $7 \pi / 6$ |  |  |
| $5 \pi / 4$ |  |  |
| $4 \pi / 3$ |  |  |
| $3 \pi / 2$ | -1 | $(3 \pi / 2,-1)$ |
| $5 \pi / 3$ |  |  |
| $7 \pi / 4$ |  |  |
| $11 \pi / 6$ |  |  |
| $2 \pi$ |  |  |

After you fill in the chart it is time to plot your points. Use the ordered pair you found and plot the points on the given coordinate plane. You will have to estimate some. For instance, $\frac{\sqrt{2}}{2}$ is approximately 0,707 . Once you are done plotting your points, use a curve to connect the points

Facts to know about the graph of $\sin (\theta)$ :

1. The domain is from $\qquad$ ). You can put input any $\qquad$ measure and find $\sin (\theta)$
2. The range is from [ $\qquad$ , $\qquad$ ].
3. Sine is symmetric to the $\qquad$ Therefore sine is an $\qquad$ function.
4. The sine function is periodic. It cycles every $\qquad$ or $\qquad$ $\stackrel{\circ}{\circ}$
5. List at least $3 x$-intercepts. $\qquad$ 6. The y-intercept is $\qquad$ .
6. The maximum value is $\qquad$ it when $x=$ $\qquad$ (list 2).
7. The minimum value is $\qquad$ it occurs when $x=$ $\qquad$ (list 2)

Part II: $f(x)=\cos (\theta) \quad$ The ordered pairs will be ( $\qquad$ ). The domain, $\theta$, will represent $\qquad$ measures. The range, $\cos (\theta)$, will represent the $\qquad$ value for cosine at $\theta$.

Now graph the function $f(x)=\cos (\theta)$. Repeat the steps you performed to graph $f(x)=\sin (\theta)$.

| $x$ | $y=\cos (x)$ | $(x, y)$ |
| :--- | :--- | :--- |
| 0 | 1 | $(0,1)$ |
| $\pi / 6$ |  |  |
| $\pi / 4$ |  |  |
| $\pi / 3$ | $1 / 2$ | $(\pi / 3,0.5)$ |
| $\pi / 2$ |  |  |
| $2 \pi / 3$ |  |  |
| $3 \pi / 4$ |  |  |
| $5 \pi / 6$ |  |  |
| $\pi$ |  |  |
| $7 \pi / 6$ |  |  |
| $5 \pi / 4$ |  |  |
| $4 \pi / 3$ |  |  |
| $3 \pi / 2$ | 0 | $(3 \pi / 2,0)$ |
| $5 \pi / 3$ |  |  |
| $7 \pi / 4$ |  |  |
| $11 \pi / 6$ |  |  |

Facts to know about the graph of $\cos (\theta)$ :

1. The domain is from ( $\qquad$ ). You can put input any $\qquad$ measure and find $\cos (\theta)$.
2. The range is from [ $\qquad$ , ].
3. Cosine is symmetric to the $\qquad$ Therefore cosine is an $\qquad$ function.
4. The cosine function is periodic. It cycles every $\qquad$ or $\qquad$ ${ }^{\circ}$.
5. List at least $3 \times$-intercepts. $\qquad$ 6. The $y$-intercept is $\qquad$ .
6. The maximum value is $\qquad$ it when $x=$ $\qquad$ (list 2).
7. The minimum value is $\qquad$ it occurs at $x=$ $\qquad$ (list 2).
